

## Installation & upgrade instructions for Fishsim2 by Simmers Dad (April 2020)

1. Download the installation file from Fishsim.net (2.13d)
  - a. <http://fishsim.net/fs2down.htm>
  - b. Password: fishsim.net
2. Run the installation file
  - a. Important: Delete the default installation folder.
  - b. Replace it with c:\fishsim2**
3. Download the latest update 2.13f from Fishsim.net or from Simmersdad.info.
  - a. <http://fishsim.net/update.php> or <http://simmersdad.info/downer/>
4. Run this installation file.
  - a. Important: Delete the default installation folder.
  - b. Replace it with c:\fishsim2**
  - c. You now have a working version that will run on windows 10

However, you will need the following updates:

1. Download Version 2.13g from <http://simmersdad.info/downer/>
2. This is not an installation file, you need to replace fishsim2.exe that is in the folder c:\fishsim2 with this new version. You may want rename the old one fishsim2.13 f.exe as backup first.
3. Download and install the latest specie and weather files from <http://simmersdad.info/downer/>
  - a. For example: All Species March 2010
  - b. Species – Objects – Weather 21 .10.07
  - c. Download the latest bait tidy as well.

Note: The specie, weather & baits are jr2 files, these can be installed from within fishsim via the menu system by putting the files into the main c:\fishsim2 folder first.

However, there is a utility called jr2ex.exe that will allow you to install addons without running Fishsim2 first. I'm, not sure if this file is included above.

If it is, double click any jr2 that has been put into the c:\fishsim2 folder and Windows will ask you how you want to open it. If you are on Windows 10, click more apps, look for another app on this pc and find jr2ex and click open to run it.

The jr2 will extract in a dos (black) window and you should then be able to click any Jr2 files to extract it automatically in future.
